

# VPX57HS-31 725 Watt DC/DC Converter

# VPX57HS-31 3U VPX DC/DC Converter

## 725-Watt Ruggedized Converter

## Developed in alignment with the SOSA™ Technical Standard

Plug-in Module, Conduction-Cooled, Six Outputs

## Description

NAI's VPX57HS-31 is a 725 Watt DC/DC Converter that plugs directly into a standard 3U VPX chassis with a VITA 62 1.0" power supply slot. This off-the-shelf solution for VITA 46.0 and VITA 65 systems is compatible with VPX specifications; supports all VITA standard I/O, signals, and features; and conforms to the VITA 62 mechanical and electrical requirements for modular power supplies. Contains Integrated IPMC, with Dual Bus IPMB-A, IPMB-B,

The VPX57HS-31 switching power supply is conduction-cooled through the card edge/wedgelock. It accepts +270 VDC input voltage and provides six outputs at 725 Watts.

The VPX57HS-31 can be used either as a single-stage module or a back-end module in a multiple power supply configuration. It supports a variety of standard features, including continuous Background Built-in-Test (BIT); remote error sensing; and protection against transients, over-voltage, over-current, and short-circuits. With its intelligent design, the VPX57HS-31 also has the flexibility to address special needs. This COTS converter is specifically designed with NAVMAT component derating for rugged defense and industrial applications. It is also designed to meet the many harsh environmental requirements of military applications.

## **Features**

- Ideal for rugged 3U VPX power applications
- Standard VPX-compatible connectors and I/O per VITA 62
- Compatible with System Management Bus per VITA 46.11
- IPMC Dual Bus IPMB-A & IPMB-B
- Off-the-shelf solution for VITA 46.0 and VITA 65 systems
- Supports all VITA standard I/O, signals, and features
- Accepts +270 VDC input
- Provides up to six outputs and I/O at up to 725 Watts
- **SOSA**<sup>™</sup> Aligned output configurations
- Continuous Background Built-in-Test (BIT)
- User Programmable
- Current share
- Environmentals per Mil-Std-810H and VITA 47
- Input transient protection per MIL-STD-704F
- Integrated EMI filtering per MIL-STD-461F

Made in the USA

Certified Small Business

# **Electrical Specifications**

DC Input Characteristic	cs			
Input	+270 VDC (+220 VDC to +320 VDC range)			
EMI/RFI	Designed to meet the requirements of MIL-STD-461F; For full system level compliance, minimal additional system filtering required			
Input Transient Protection	Per MIL-STD-704F			
Output Power	725W max @ 75°C, derate linearly to 600W at 85°C (see Output Power Table, page 3)			
Output Voltage	VPX outputs standard (see Output Power Table)			
Efficiency	89% at full load			
Switching Frequency	150kHZ, 300kHZ			
Line Regulation	Within 0.5% or 20 mV (whichever is greater) for low to high line changes at constant load; For current share units: 1.5% for VS1, VS2, VS3; 2% for +3.3 VDC_Aux; 2% for +12 VDC_Aux			
Load Regulation	0.5% or 20 mV (whichever is greater) for 0 to 100% of rated load at nominal input line; With remote sense: 1% for -12 VDC_Aux , +12 VDC_Aux, +3.3 VDC_Aux; For current share units: 1.5% for VS1, VS2, VS3, +3.3 VDC_Aux; 2% for +12 VDC_Aux			
PARD (Noise and Ripple)	1% or 50 mV p-p max per VITA 62; measurements are made with a 20 MHz bandwidth instrument connected on load wires < 5 inches from power supply and terminated with 1uF capacitors across load lines			
Load Transient Recovery	Output voltage returns to regulation limits within 0.5 msec, half to full load			
Load Transient Under/Overshoot	5% of nominal output voltage set point (1.4 V max)			
Short Circuit Protection	Protected for continuous short circuit with automatic recovery			
Current Limiting	All outputs 125% to 130%			
Over Voltage Protection	Automatic electronic shutdown if outputs exceed 125% $\pm$ 10%			
Remote Error Sensing	Sensing pins compensate for up to 0.5 V drop on VS1 to VS3 outputs			
Isolation Voltage	1,000 VDC input to output and input to case; 100 VDC output to case			
Insulation Resistance	50 Mega Ohm at 500 VDC			

All specifications are subject to change without notice.

# Additional Specifications

Physical/Environmental				
Temperature Range	Operating: -40°C to +85°C at 100% load (temperature measured at card edge, conduction via card edge); Storage: -55°C to +105°C per VITA 47 CC4)			
Temperature Coefficient	0.01% per °C			
Shock	40 G's each axis per MIL-STD-810H, Method 516, Procedure 1. VITA 47 OS2 Hammer shock per MIL-S 901			
Acceleration	6 G's per MIL-STD-810H, Method 513, Procedure II			
Vibration	Per MIL-STD-810H, Method 514, Procedure 1; 12 GRMS, VITA 47, Class V3			
Humidity	95% at 71°C per MIL-STD-810H, Method 507 (non-condensing)			
Altitude	1,500 feet Below Sea Level to 60,000 feet Above Sea Level per VITA 47			
	70,000 Feet Optional with Enhanced High Voltage Connector; Refer to Option Code Table			
Salt & Fog	Per MIL-STD-810H, Method 509, VITA 47 Class SL1			
Sand/Dust	Per MIL-STD-810H, Method 510			
Fungus	Per MIL-STD-810H, Method 508			
ESD	15 kV EN61000-4-2 per VITA 47			
Dimensions	See Mechanical Layout			
Enclosure	Aluminum housing to aluminum baseplate			
Finish	Chemical film IAW MIL-DTL-5541, Type II, Class 3			
Interface	50 Micro-Inch Gold on contacts; plated tails for tin whisker mitigation			
	See Connector Part Numbers below and select by option code number			
Weight	1.6 lbs. Typical			

All specifications are subject to change without notice.

# Signal Types

Signal	Description	
ENABLE*	Turns off all of the output voltages, including 3.3 V_AUX, when signal is High. ENABLE* is pulled Low by using a mechanical switch which connects it to SIGNAL_RETURN. A Logic output can also be used to drive the ENABLE*. Opening the switch would turn off all the outputs; closing the switch or applying the Logic output would enable the outputs to come on depending on the state of INHIBIT*. An input of <0.8 VDC is regarded as a Low and an input of >2.0 VDC is regarded as a High. A no-connect is also regarded as a High. Along with INHIBIT*, this signal determines the output power status of the VPX57HS-31 (see Power Status Table below).	
INHIBIT*	Turns off all the output voltages. In most implementations, the signal is expected to leave 3.3 V_AUX on. Pulling INHIBIT* Low turns off VS1, VS2, VS3, and ±12 VDC_Aux outputs. An input of <0.8 VDC is regarded as a Low and an input of >2.0 VDC is regarded as a High. A no-connect is also regarded as a High. Along with ENABLE*, this signal determines the output power status of the VPX57HS-31 (see Power Status Table below).	
SYSRESET*	An active low open-collector line driven by the Power Monitor module. Signal ensures a clean, stabilized startup based on monitoring the output voltage levels in accordance with VITA 46.0, paragraph 4.8.11. Timing can be factory customized.	
FAIL*	Indicates failure when any of the outputs are not within spec. Signal complies with VITA 65 for active Low. FAIL* signal is Open Drain. It is expected that there will be a pull-up resistor on the backplane.	
Over Temp Warn	Can be read through I <sup>2</sup> C; refer to I <sup>2</sup> C programming section, Status Register Bit 5.	
Over Temp Shut Down	The PS shall self-shutdown or self-regulate to prevent damage if the temperature is exceeded.	
Geographical Addressing	As defined in VITA 46	
Current Share	Allows multiple power supplies to share system load for VS1 to VS3 outputs. Connection is made per designated pins for each output.	
Protocol	Per VITA 46.11 System Management Bus.	
Status LED	See LED Status table below	

# **LED Status**

LED State	Meaning
Off	Input Low
Green (Steady)	Vout OK; All outputs are good
Red (Steady)	Fail; Follows same logic as FAIL* signal
Blinking Green	Unit disabled
Blinking Red	Over Voltage or Over Temperature ( all outputs are off)

## **Power Status**

Control In	put States	Power O	utput States
ENABLE*	INHIBIT*	+3.3V_AUX	VS1, VS2, VS3, +12V_AUX & -12V_AUX
High	High	Off	Off
High	Low	Off	Off
Low	High	On	On
Low	Low	On	Off

## I<sup>2</sup>C Communication

### Supports VITA 46.11 Tier 2 dual bus

### Provides all mandatory Sensor Data Record (SDR) and all required FRU data as well as real-time analog data

1. Hardware Interface.

Electrical interface is based on I2C parameters at 100 kHz. The backplane or I2C master controller should provide pull up resistors on SDA and SCL lines to a 3.3V rail.

2. Address.

The I2C Address is 7 bits. Default base address is 0x20. \*GA0, and \*GA1 provides 2 LSB's for the address. The \*GA pins have pullup resistors internal to the power supply to 3.3V. When left open, the address will be 0x20, with both grounded the address will be 0x23, see table below.

P	I2C	
*GA1	*GA1 *GA0	
Pin B5	Pin A5	
High	High	0x20
High	Gnd	0x21
Gnd	High	0x22
Gnd	Gnd	0x23

3. Supports Legacy Slave Mode Commands Data Read - Get Sensor Reading results

# Response

	Byte	Data Field	Data
Request Data	1	cmd	See table
	2 to n-1	Data If Required by cmd or Zero ChkSum* if no Data required.	
	n	Zero ChkSum* if Data was required by cmd	
Response Data	1	Completion Code – Echo cmd Number	
	2 to n-1	Per cmd Response	
	n	Zero ChkSum	

\*Note : Slave address should not be included in Zero Checksum calculation.

VPX57HS-31A001 Rev. 1

#### 4. Commands

Sensor #	Name	Description
21H	Composite Sensor	64 bytes of scanned sensor data. Data is continually scanned and available for report. Data consists of 2 bytes of data for each of the 11 sensors and FRU data.
55H	Status Write Command	Writes Status byte on Composite Sensor.
44H	Firmware release date	22 byte response. Month/Day/Year Hr/Min/Sec in ASCII form.
45H	Hardware Address	3 byte response. Reports address set by GA0*-GA1*

### 4.1 Composite Sensor Read Command – 21H

Response BYTE #	Data Type	Meaning			
0	Completion Code – 21h	Echo of the command			
1	Status Register 0, MS Bit	Refer to table below			
2-3	Signed Integer, MSB First	Temperature as follows °C = (Reading * 100 / 16384)			
4-5	U Integer, MSB First	Voltage on VS1, 12V = 16384			
6-7	U Integer, MSB First	Voltage on VS2, 3.3 = 16384			
8-9	U Integer, MSB First	Voltage on VS3, 5V = 16384			
10-11	U Integer, MSB First	Voltage on 3.3Aux, 3.3V = 16384			
12-13	U Integer, MSB First	Voltage on +12V Aux, 12V = 16384			
14-15	U Integer, MSB First	Absolute Voltage on -12V Aux, 12V = 16384			
16-17	U Integer, MSB First	Current on VS1, 30A = 16384			
18-19	U Integer, MSB First	Current on VS2, 20A = 16384			
20-21	U Integer, MSB First	Current on VS3, 40A = 16384			
22-23	U Integer, MSB First	Current on 3.3Aux, 4A = 16384			
24-25	U Integer, MSB First	Current on +12VAux, 1A = 16384			
26-27	U Integer, MSB First	Absolute Current on -12VAux, 1A = 16384			
28-29	U Integer, MSB First	Internal Reference, 2.5V = 16384			
30-31		Reserved			
32-51	Character String	Part Number			
52-53	U Integer, MSB First	S/N Hi			
54-55	U Integer, MSB First	S/N Low			
56-57	U Integer, MSB First	Date Code (Year/Week)			
58-59	U Integer, MSB First	Hardware Rev			
60-61	U Integer, MSB First	Firmware Rev.			
62	Reserved	Reserved			
63	Zero Checksum	Value required to make the sum of bytes 0 to 62 add to a multiple of 256 (decimal).			

Status Reg 0	)	R/Set	R/Set	R/W	R/W	R/W	R	R
Bit	7	6	5	4	3	2	1	0
	x	FAIL	OTWarning	SWPriority	*SW Inh	*SW En	*HW Inh	*HW En

Bits 5 AND 6 (OTWarning - FAIL) are Read and write. They are clear at startup. User can set them with a Status Write command. Hardware will clear them if there is a fault.

Bit 4 (SWPriority) is Read and write. It is clear at Startup. When clear the unit will be controlled by the hardware enable and inhibit signals. When set, the unit will be controlled by the SW inhibit and enable signals.

Bits 3 and 2 (SWInh SWEn ) are read and write. Their logic works the same as the logic for the hardware Enable and Inhibit.

*SWEnable	*SWInhibit	OUTPUTS
0	0	INHIBIT (3.3V Aux is On, all other outputs are off)
0	1	ON
1	0	OFF
1	1	OFF

Bits 1 and 0 (HWIn - HWEn) are read only. They show the state of \*Enable and \*Inhibit pins while SWPriority is low.

#### 4.2 Status Write Command - 55H

BYTE #	Data Type	Meaning
0	U Character – 55H	Command
1	U Character	Data
2	Zero Checksum	Value required to make the sum of bytes 0 and 1 add to a multiple of 256 (decimal).

The command to write to Status byte is 55h, followed by 8-bit data then zero checksum.

Example: To send a command to clear the faults and turn on all the outputs, the following sequence must be sent. 55h 78h 33h;

55h is the command needed to write to status byte zero.

78h data for byte zero,

Bit 7 set: don't care bit.

Bit 6 set: FAIL signal is high, software will clear it if unit fails

Bit 5 set: OTWarning signal is high, software will clear it if unit is close to 75 degrees.

Bit 4 set: Software has priority to enable/disable unit.

Bit 3 set: SWInhibit is high

Bit 2 low: SWEnable is low.

33h Value to achieve a sum of zero.

#### 4.3 Firmware release date – 44H

Response BYTE #	Data Type	Meaning
0	Completion Code – 44H	Echo of the command
1-20	Character String	Date
21	Zero Checksum	Value required to make the sum of bytes 0 to 20 add to a multiple of 256 (decimal).

#### 4.4 Hardware Address – 45H

Response BYTE #	Data Type	Meaning	
0	Completion Code – 45H	Echo of the command	
1	U Character	I2C Hardware Address	
2	Zero Checksum	alue required to make the sum of bytes 0 and 1 add to a multiple c 256 (decimal).	

# **Output Configurations**

725 Watt Power (refer to Notes Below)									
	Standard Output Configuration			+12V Heavy Configuration			+12V Only Configuration per SOSA™		
Pin Number	Designation (Power Form)	Volts	Amps	Designation (Power Form)	Volts	Amps	Designation (Power Form)	Volts	Amps
P6	VS1 (PO1)	+12Vdc	40	VS1 (PO1)	+12Vdc	60*	VS1 (PO1)	+12Vdc	60*
LP2	VS2 (PO2)	+3.3Vdc	20	VS2 (PO2)	+3.3Vdc	20	+3.3V_Aux	+3.3Vdc	20
P3	VS3 (PO3)	+5Vdc	40	VS1 (PO1)	+12Vdc	60*	VS1 (PO1)	+12Vdc	60*
В3	+12V_Aux	+12Vdc	3	+12V_Aux	+12Vdc	3			
C6	-12V_Aux	-12Vdc	3	-12V_Aux	-12Vdc	3			
A4,B4,C4,D4	+3.3V_Aux	+3.3Vdc	4	+3.3V_Aux	+3.3Vdc	4			

\*Total of 60A capability from PO1 combined

Power limited to 725W at 75°C and 600W at 85°C
